

DID YOU KNOW?

With advanced reproductive technologies such as In Vitro Fertilization (IVF), breeders can go even further in multiplying the success of their breeding program.

When compared to conventional embryo transfer, IVF is an excellent option in certain circumstances:

- **Capturing genetics previously unavailable from...**
 - Pregnant donors.
 - Virgin heifers.
 - Donors unsuccessful in conventional ET.
 - Down or injured animals.
- **Keeping cattle on an annual production cycle by...**
 - Creating pregnancies from a donor gestating her natural calf.
 - Generating offspring from elite heifers, allowing them to calve at the appropriate time.
- **Utilizing sexed semen from any bull by...**
 - Thawing previously frozen semen and sorting it using reverse sort. Sexed embryos are a reality through the IVF and reverse sort procedure.
